

Amendments To The Claims

1. (Currently Amended) A method of identifying bacteria, comprising:
 - a) providing:
 - i) amplified random genomic DNA sequences from a plurality of bacterial reference species, wherein said amplified genomic sequences represent between 1-3% of each genome range between 1—2 kb and are arrayed on a solid support, and wherein said amplified genomic DNA sequences comprise unknown sequences,
 - ii) labeled target DNA from a test bacteria of interest, wherein said labeled target DNA is labeled with a first fluorescent dye, and
 - iii) labeled reference DNA from at least four of said bacterial reference species wherein said labeled reference DNA is labeled with a second fluorescent dye,
 - b) hybridizing said target DNA and said reference DNA to said amplified genomic DNA sequences wherein each hybridized target DNA has a fluorescent target DNA signal, and each hybridized reference DNA has a fluorescent reference DNA signal,
 - c) comparing said fluorescent target DNA signal with said fluorescent reference DNA signal, and
 - d) identifying the species of said test bacteria.
2. (Original) The method of claim 1, wherein said test bacteria are from a sample obtained from a subject.
3. (Previously Presented) The method of claim 1, wherein said test bacteria are pathogenic.
4. (Original) The method of claim 1, wherein said test bacteria are environmental isolates.
5. (Original) The method of claim 1, wherein said solid support is a microchip.

6. (Previously Presented) The method of claim 26, wherein said calculating comprises statistical analysis.

7. (Canceled)

8. (Original) The method of claim 1, further comprising the step of producing hybridization profiles of said test and reference bacteria.

9. (Currently Amended) A method of identifying bacteria, comprising:

- a) providing:
 - i) amplified random genomic DNA sequences from a plurality of bacterial reference species, wherein said amplified genomic DNA sequences represent between 1-3% of each genome ~~range between 1—2 kb~~ and are arrayed in a plurality of spots on a solid support ~~so as to permit the sampling of 1-3% of each genome,~~
 - ii) labeled target DNA from a test bacteria of interest, wherein said labeled target DNA is labeled with a first fluorescent dye, and
 - iii) labeled reference DNA from at least four of said bacterial reference species, wherein said labeled target DNA is labeled with a second fluorescent dye,
- b) hybridizing said target DNA and said reference DNA to said amplified genomic, wherein each hybridized target DNA has a fluorescent target signal, and each hybridized reference DNA has a fluorescent reference signal, and
- c) comparing said fluorescent target signal with said fluorescent reference signal, and identifying the species of said test bacteria.

10. (Original) The method of claim 9, wherein said test bacteria are from a sample obtained from a subject.

11. (Previously Presented) The method of claim 10, wherein said test bacteria are pathogenic.

12. (Original) The method of claim 9, wherein said test bacteria are environmental isolates.
13. (Original) The method of claim 9, further comprising the step of producing hybridization profiles of said test and reference bacteria.
14. (Previously Presented) The method of claim 27, wherein said calculating comprises statistical analysis.
- 15-21. (Canceled)
22. (Currently Amended) The method of Claim 1, wherein said solid support comprises between 60 and $[[5]]100,000$ of said genomic sequences.
23. (Previously Presented) The method of Claim 1, wherein said solid support comprises 96 of said genomic sequences.
24. (Currently Amended) The method of Claim 9, wherein said solid support comprises between 60 and $[[5]]100,000$ of said genomic sequences.
25. (Previously Presented) The method of Claim 9, wherein said solid support comprises 96 of said genomic sequences.
26. (Previously Presented) The method of Claim 1, wherein said comparing comprises calculating a log ratio of said fluorescent target signal to said fluorescent reference signal.
27. (Previously Presented) The method of Claim 9, wherein said comparing comprises calculating a log ratio of said fluorescent target signal to said fluorescent reference signal.

28. (Currently Amended) A method of identifying bacteria, comprising:

- a) providing:
 - i) amplified random genomic DNA sequences from a plurality of bacterial reference species, wherein said amplified genomic DNA sequences represent between 1-3% of each genome range-between 1—2 kb and are arrayed in a plurality of spots on a solid support ~~so-as-to-permit-the sampling of 1-3% of each genome,~~
 - ii) labeled target DNA from a test bacteria of interest, wherein said labeled target DNA is labeled with a first fluorescent dye, and
 - iii) labeled reference DNA from at least four of said bacterial reference species wherein said labeled target DNA is labeled with a second fluorescent dye,
- b) hybridizing said target DNA and said reference DNA to said amplified genomic sequences, wherein each hybridized target DNA has a fluorescent target signal, and each hybridized reference DNA has a fluorescent reference signal, and
- c) determining an evenness value for each of said hybridized bacterial reference genomic sequences by comparing said fluorescent target signal with said fluorescent reference signal, and identifying the species of said test bacteria when said hybridized bacterial reference genomic sequence evenness value is greater than 20°.
